

GIAHS

Globally Important Agricultural Heritage Systems

Exploring potential of the alpine landscapes in their inclusion in GIAHS

GIAHS (FAO Agricultural Heritage Program)

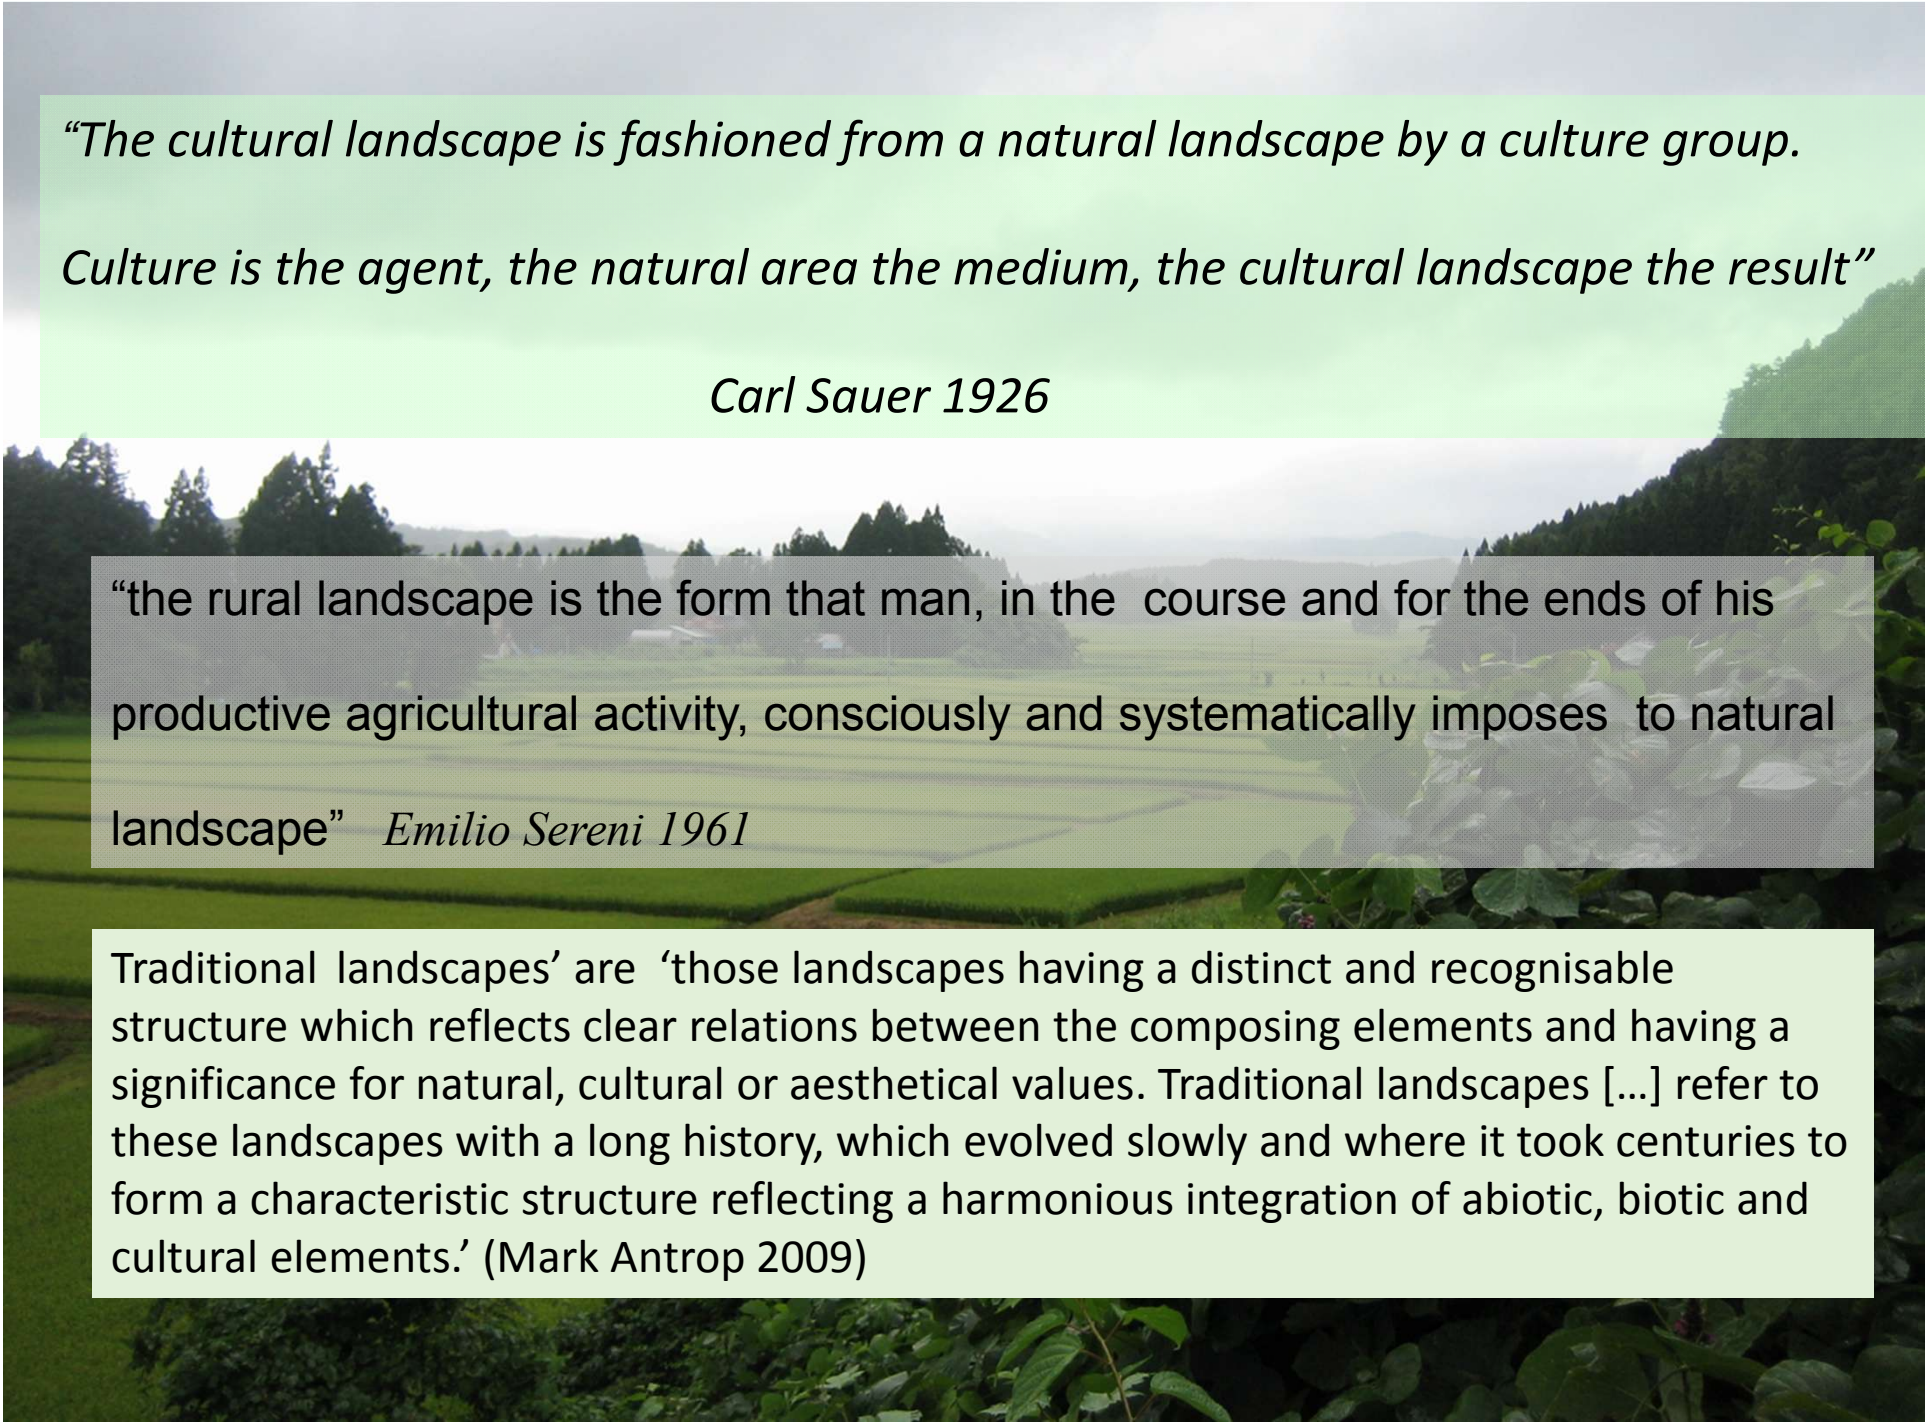

Globally Important Agricultural Heritage Systems

Definition

“Remarkable Land Use Systems and landscapes which are rich in biological diversity evolving from the co-adaptation of a rural community with its environment and its needs and aspirations for sustainable development (FAO, 2002)”.

“The cultural landscape is fashioned from a natural landscape by a culture group.

Culture is the agent, the natural area the medium, the cultural landscape the result”

Carl Sauer 1926

“the rural landscape is the form that man, in the course and for the ends of his productive agricultural activity, consciously and systematically imposes to natural landscape” *Emilio Sereni 1961*

Traditional landscapes’ are ‘those landscapes having a distinct and recognisable structure which reflects clear relations between the composing elements and having a significance for natural, cultural or aesthetical values. Traditional landscapes [...] refer to these landscapes with a long history, which evolved slowly and where it took centuries to form a characteristic structure reflecting a harmonious integration of abiotic, biotic and cultural elements.’ (Mark Antrop 2009)

Landscape as an approach for the government of the rural territory

the integration among systems in space and time

Population Growth (x 1.000.000)

year n

1700	605
1800	975
1900	1628
1950	2531
1975	4080

GIAHS

Globally Important Agricultural Heritage Systems

GIAHS

Globally Important Agricultural Heritage Systems

Criteria for inscription

Preamble

1. The proposed site should be of global importance. This is a composite criterion under which the overall value of an agricultural system with historical background and contemporary relevance is recognized as a heritage of human kind.
2. The features of the system should be summarized in terms of their agricultural and cultural heritage value, their relevance to global concerns addressing sustainable development, biocultural diversity, including agro-biodiversity and ecosystems management.
3. Five criteria have been developed to represent the totality of the functionalities, goods and services provided by the system. The criteria reflect the complex relationships and linkages between the system's elements as an integrative holistic system.
4. The proposed GIAHS site will be assessed based on the criteria and an action plan. The assessment will take into account a wide variation in the specific features of the proposed site which has been formed and developed in different geographic, climatic, and socio-economic conditions.

Selection Criteria

1. Food and Livelihood Security

The proposed agricultural system contributes to food and/or livelihood security of local communities.

This includes a wide variety of agricultural types such as self-sufficient and semi-subsistence agriculture where provisioning and exchanges take place among local communities, which contributes to rural economy.

2. Agro-biodiversity

Agricultural biodiversity, as defined by FAO as the variety of animals, plants and micro-organisms that are used directly or indirectly for food and agriculture, including crops, livestock, forestry and fisheries. The system should be endowed with globally significant biodiversity and genetic resources for food and agriculture (e.g. endemic, domesticated, rare, endangered species of crops and animals).

4. Cultures, Value systems and Social Organisations

Cultural identity and sense of place are embedded in and belong to specific agricultural sites. Social organizations, value systems and cultural practices associated with resource management and food production may ensure conservation of and promote equity in the use and access to natural resources. Such social organizations and practices may take the form of customary laws and practices as well as ceremonial, religious and/or spiritual experiences.

5. Landscapes and Seascapes Features

GIAHS sites should represent landscapes or seascapes that have been developed over time through the interaction between humans and the environment, and appear to have stabilized or to evolve very slowly. Their form, shape and interlinkages are characterized by long historical persistence and a strong connection with the local socio-economic systems that produced them. Their stability, or slow evolution, is the evidence of integration of food production, the environment and culture in a given area or region. They may have the form of complex land use systems, such as land use mosaics, water and coastal management systems.

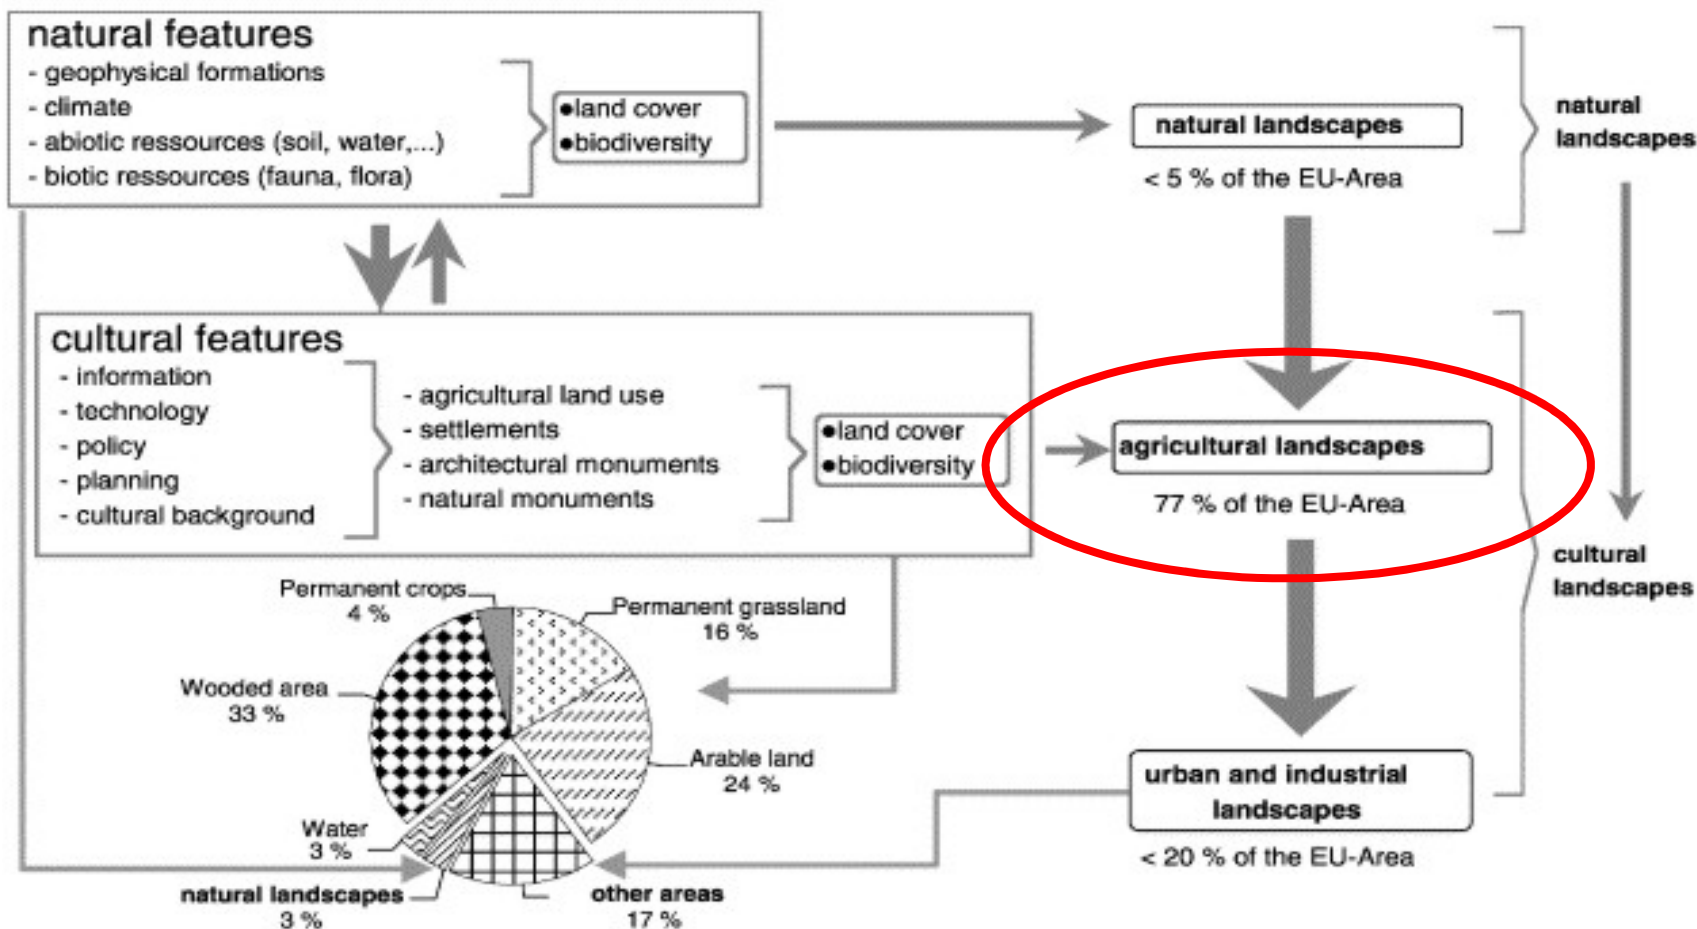

Action Plan for Sustainability of the System

An Action Plan for a **dynamic conservation** of the proposed GIAHS site must be developed with the proposal. The recommended items to be included in the Action Plan would be an analysis of threats and challenges and detailed descriptions of the policies, strategies, actions and outcomes which are already under implementation and/or will be implemented in the area by various relevant stakeholders to promote dynamic conservation of GIAHS with the following supplementary information:

- Identify and analyze threats and challenges, including socio-economic pressures and environmental changes to the continuity of the existence, sustainability and viability of the system;
- What are the proposed policies, strategies and actions and how will they respond to the threats as described;
- How these policies, strategies and actions will contribute to the dynamic conservation of the proposed GIAHS site;
- How multi-stakeholders are involved, including local communities, and support the implementation of the Action Plan at local, national and international levels;
- How policies, strategies and actions can be used to leverage funding and/or mobilize resources at the local, national and/or international level;
- How monitoring and evaluation of the progress and the effect of the implementation of the Action Plan will be undertaken.

The need for a paradigm shift:

Biodiversity

α diversity: number of species within a given area

β diversity: relation species diversity and habitat diversity

γ diversity: geographical (measured at large scale)

European Landscape Convention (Firenze – 2000) Council of Europe - 35 signatory states

Art. 3 – Aims

The aims of this Convention are to promote landscape protection, management and planning, and to organise European co-operation on landscape issues.

Art.6

- i) to identify its own landscapes throughout its territory;
- ii) to analyse their characteristics and the forces and pressures transforming them

The Common Agricultural Policy

I Pillar – direct payments

44- Ecological focus areas should be established, in particular, in order to safeguard and improve biodiversity on farms. The ecological focus area should therefore consist of areas directly affecting biodiversity such as land lying fallow, **landscape features**, terraces, buffer strips, afforested areas and agro-forestry areas, or indirectly affecting biodiversity through a reduced use of inputs on the farm.

45- “.... ecological focus area, the Commission should ensure that they aim to improve the general environmental performance of the holding, in particular as regards biodiversity, the improvement of soil and water quality, the **preservation of landscape** and meeting the climate change mitigation and adaptation objectives.

Rural landscapes in the UNESCO WHL

**They are included among cultural landscapes in the category:
“organically evolved landscape”.**

sub-category:

- continuing landscape is one which retains an active social role in contemporary society closely associated with the traditional way of life, and in which the evolutionary process is still in progress. At the same time it exhibits significant material evidence of its evolution over time.

Main Elements of the application:

- Authenticity
- Integrity
- Attributes
- Management System

United Nations
Educational, Scientific and
Cultural Organization

MAB Programme

By focusing on sites internationally recognized within the [World Network of Biosphere Reserves](#), the MAB Programme strives to:

- identify and assess the changes in the biosphere resulting from human and natural activities and the effects of these changes on humans and the environment, in particular in the context of climate change;
- study and compare the dynamic interrelationships between natural/near-natural ecosystems and socio-economic processes, in particular in the context of accelerated loss of biological and cultural diversity with unexpected consequences that impact the ability of ecosystems to continue to provide services critical for human well-being;
- ensure basic human welfare and a liveable environment in the context of rapid urbanization and energy consumption as drivers of environmental change;
- promote the exchange and transfer of knowledge on environmental problems and solutions, and to foster environmental education for sustainable development.

THE THREE FUNCTIONS OF BIOSPHERE RESERVES:

3.1 "Conservation - contribute to the conservation of landscapes, ecosystems, species and genetic variation".

3.2 "Development - foster economic and human development which is socio-culturally and ecologically sustainable".

3.3 "Logistic support - support for demonstration projects, environmental education and training, research and monitoring related to local, regional, national and global issues of conservation and sustainable development".

• CRITERIA FOR DESIGNATION AS A BIOSPHERE RESERVE:

4.1 "Encompass a mosaic of ecological systems representative of major biogeographic region(s), including a gradation of human interventions".

4.2 "Be of significance for biological diversity conservation".

4.3 "Provide an opportunity to explore and demonstrate approaches to sustainable development on a regional scale".

4.4 "Have an appropriate size to serve the three functions of biosphere reserves"
